

# SuperHeat Milk Warmer

## Features:

- Pre-set the digital temperature range
- Teflon coated for easy cleaning
- Temperature sensor in base for accuracy
- New shape cone element for faster warming

## Product Information:

The new 240v teflon coated SuperHeat Digital Milk Warmer is the latest advancement in milk warming.

The innovative temperature sensor now measures liquid temperature at its coldest point - close to the base. This

means the liquid reaches pre-set temperature quickly and more accurately and makes continuous heating possible without timing. The teflon coated 2300W element is now in a conical shape which heats the liquid faster by promoting greater circulation. As warm liquid rises, and cool liquid falls the circulation is accelerated by the constricted flow area of the cone shape.

Select one of two heating programs with the touch of a button on the illuminated display: one button for large volumes and one button for smaller volumes of less than 9 litres. The SuperHeat will store your preferred temperature setting (from 10-90 degrees Celsius) even when unplugged. This ensures your calves receive a precise and consistent temperature each feed.
