

Septicare Hoof Bond

Features:

- Big 250ml tube for 12 applications
- Use in any weather
- No need to dry hoof
- Use any regular caulking gun

Product Information:

Septicare II XL is a fast drying two-component adhesive for wooden block application in hoof care. The affected claw is raised and relieved by bonding a wooden block to the healthy claw. Septicare II XL provides significant time saving and economy as the adhesive is applied fast and bonds quickly, so the farmer saves time treating cows. The cow suffers less stress and pain and is ready to move quicker, so the treatment doesn't affect milk production.

Septicare II XL adhesive is able to be used in a range of weather conditions. It can be applied, and cures, in temperatures between 0°C to 40°C and even including wet conditions. It is effectively used in far more harsh conditions, than the New

Zealand climate. Septicare II XL is very easy to use, there is no need for it to be preheated or the hoof to be dried. The mixing tip delivers the two-part components optimally-mixed for maximum bonding. The block will wear down with the cow walking on it, giving the effected claw time to heal before it bears weight again. Septicare II XL's unique cartridge allows for easy opening simply by unscrewing the cap and pulling out the separation tip. The cartridge also fits on all standard caulking guns.
